Product Description and Specifications
1 kVA ACDC Power Supply Model ACDC-10

Overview:

The ACDC-10 is a small portable AC and DC power supply intended for circuit breaker charging motors and other general-purpose applications. It will provide DC voltage in three nominal ranges from 0 to 120, 240, and 480 volts at 0.86 kVA, and AC voltage in three nominal ranges from 0 to 140, 280, and 560 volts at 1.0 kVA. The unit is housed in a rugged plastic enclosure approximately 20" x 11" x 18" and weighs less than 65 lbs.

Basic Description and Operation:

This instrument is housed in a rugged waterproof case with a hinged lid. The input connection is by way of a recessed three prong male inlet compatible with standard IEC cords. The input is protected and controlled by a 10-amp single pole circuit breaker. When it is turned ON, a dual-deck variable autotransformer (Vernier) is energized, as well as a 0 – 600 volt digital meter. The output arm(s) are protected by a two-pole breaker. The variable output of the Vernier is connected to the primaries of two 700 VA toroidal transformers. The secondaries are connected in series and parallel configuration by means of a multi-deck six position selector switch. The AC output is monitored by the 0 - 600 VAC digital meter. An additional resistor is added in DC mode to read the DC output voltage for open circuit or resistive loads.

The output is controlled by means of a three-position rotary switch. It has maintained, momentary, and center OFF positions. When turned ON, a relay is energized and the Output On lamp is illuminated. The contacts of the relay provide AC voltage directly to one pair of yellow binding posts and through a full-wave bridge rectifier to provide DC to a pair of red and black binding posts.

A 20 kOhm load resistance is connected to the DC output along with a 12-volt Zener diode. This provides a 3 - 12 watt load for the DC output.

This power supply has no filter capacitors on the 240VDC and 480VDC Output modes and is intended to be operated with no load capacitance. If a capacitive load is applied, the output voltage may increase to as much as 140% of the unfiltered output value, and the voltmeter will not read correctly. The voltmeter will read the unloaded AC voltage that will be applied to the output. The actual AC voltage will drop by as much as 11% under rated load, and the voltmeter will read the actual voltage. The calibration resistor for DC will be set so that the voltmeter reads the expected DC output at no load, but this will drop by 11% or more depending on actual load. Snubbers are connected across the output terminals to reduce noise and high voltage spikes when connected to inductive loads.

The TIMER jacks may be used to start an external timer when the output voltage is applied to the load. These contacts consist of a solid-state relay rated at 0.1 amps and 200 V.

The Remote Jacks may be used to remotely turn output on via solid state relay these are dry contacts.
